**What is the digestive system MCQ?** The main organs of the digestive system include the mouth, pharynx, oesophagus, stomach, small and large intestine, rectum and anus. There are various types of digestive glands present, e.g. salivary glands, pancreas, liver, etc.

## **What are some good questions about the digestive system?**

**What is the gastrointestinal system also known as \_\_\_\_\_ or \_\_\_\_\_?**

The digestive system is made up of the gastrointestinal tract—also called the GI tract or digestive tract—and the liver, pancreas, and gallbladder. The GI tract is a series of hollow organs joined in a long, twisting tube from the mouth to the anus.

**What is the function of the stomach Mcq?** The major function of the stomach is to store and digest the food and liquid one consumes during meals. It produces hydrochloric acid and enzymes to help digest food and other foreign objects like bacteria.

**What organ neutralizes stomach acid?** The pancreas makes enzymes that help digest proteins, fats, and carbs. It also makes a substance that neutralizes stomach acid. These enzymes and bile travel through special pathways (called ducts) into the small intestine, where they help to break down food.

**Which is the longest organ of the digestive system in the human body?** The small intestine is the longest digestive organ. It consists of a long narrow tubular part that is divided into three parts, namely, Duodenum, Jejunum, and Ileum. Approximately, the length of the small intestine is about 6 meters long.

## **What are 5 amazing facts about the digestive system?**

**What are the 4 most important organs in the digestive system?** The main organs that make up your digestive system are the organs known as your gastrointestinal tract. They are: your mouth, esophagus, stomach, small intestine, large intestine and anus. Assisting your GI organs along the way are your pancreas, gallbladder and liver.

## **What are the 3 most important parts of the digestive system?**

**What are five gastrointestinal diseases?** Common digestive disorders include gastroesophageal reflux disease, cancer, irritable bowel syndrome, lactose intolerance and hiatal hernia. The most common symptoms of digestive disorders include bleeding, bloating, constipation, diarrhea, heartburn, pain, nausea and vomiting.

**What is the nickname of the digestive system?** Another name for the gastrointestinal tract (GI) is the alimentary canal or digestive tract. The GI tract is a long tubular structure that starts with the mouth and ends with the anus.

**Which is one major function of the gastrointestinal system?** The main functions of the GI system include ingestion and digestion of food, nutrient absorption, secretion of water and enzymes, and excretion of waste products.

**What is the most important function of the stomach?** Stomach: An organ with strong muscular walls, the stomach holds the food and mixes it with acid and enzymes that continue to break the food down into a liquid or paste. Small Intestine (Small Bowel): Almost 20 feet long, the small intestine is the workhorse of the digestive system.

**Which content in food is good for gastrointestinal health?** Doctors say that if you want your gut to work better, choose whole grains, since optimal colon function requires at least 25 grams of fiber daily. Compared to refined carbohydrates, like white bread and pasta, whole grains provide lots of fiber, as well as added nutrients, such as omega-3 fatty acids.

**Which 4 are functions of the stomach?** The core function of the human stomach is as an aid to digestion. The four key components of gastric digestive function are its function as a reservoir, acid secretion, enzyme secretion and its role in gastrointestinal motility.

**What pH is your stomach?** Normal Results. The normal volume of the stomach fluid is 20 to 100 mL and the pH is acidic (1.5 to 3.5). These numbers are converted to actual acid production in units of milliequivalents per hour (mEq/hr) in some cases.

**What is the pH of the intestines?** The pH gradually increases in the small intestine from pH 6 to about pH 7.4 in the terminal ileum. The pH drops to 5.7 in the caecum, but again gradually increases, reaching pH 6.7 in the rectum. The physiological background of these pH values is discussed.

**What destroys stomach acid?** H. pylori infection causes gastritis, which leads to less stomach acid production<sup>4</sup>. Autoimmune gastritis – an autoimmune disease where the immune system destroys the acid producing cells in the stomach called parietal cells<sup>5</sup>. This can also lead to vitamin B12 deficiency, or pernicious anaemia.
